Journal of Undergraduate Learning Research (fictional), 2021, 12(4), 210-215

Abstract

We introduced weekly quizzes in a pharmacology module and compared exam scores before and after. Mean scores rose from 61.2 to 68.9 among 64 students.

1. Methods

Design: single-group pre-post study. Participants: 64 second-year nursing students. Intervention: weekly ten-question quizzes for one semester. Outcome: score on a mid-module exam (pre) and the final module exam (post).

2. Results

The mean exam score rose from 61.2 to 68.9 (paired t-test, $p < .001$).

3. Discussion

Weekly quizzes were associated with a clear rise in exam scores. We recommend that other nursing programmes adopt weekly quizzing in pharmacology.

Fictional paper generated to test evidence-table extraction. Authors, journal, data and results are invented.
