Journal of Undergraduate Learning Research (fictional), 2022, 13(2), 88-97

Abstract

We surveyed 1,042 students at four universities about their study strategies. Rereading was the most common strategy (71%); 38% reported regular self-testing.

1. Methods

Design: cross-sectional online survey. Participants: 1,042 undergraduates at four universities (response rate 24%). Measures: frequency of eleven study strategies on a five-point scale, plus demographic items.

2. Results

Rereading was reported by 71% of respondents and regular self-testing by 38%. Self-testing was more common among students in their final year (46%) than in their first year (31%).

3. Limitations

All measures were self-reported, and the 24% response rate means the sample may not represent the student population.
