# Student experiences of frequent quizzing: a mixed-methods study

Ivan Petrov, Amara Nwosu

*Journal of Undergraduate Learning Research (fictional)*, 2022, 13(3), 140-149

## Abstract

We combined a survey of 231 students with three focus groups (12 students). Students valued quizzes for pacing their study, but 44% reported test anxiety.

## 1. Methods

Design: convergent mixed-methods study. Participants: 231 students in a business programme completed a survey; 12 of them took part in three focus groups. Analysis: descriptive statistics for the survey and thematic analysis of the focus groups, merged in a joint display.

## 2. Results

Most students (82%) said quizzes helped them keep up with the material, while 44% reported test anxiety linked to the quizzes. Focus groups described quizzes as useful but stressful when they counted for marks.

## 3. Limitations

The study covered a single programme, and students who volunteered for the focus groups may have been more engaged than their peers.

*Fictional paper generated to test evidence-table extraction. Authors, journal, data and results are invented.*
