Journal of Undergraduate Learning Research (fictional), 2023, 14(4), 230-238

Abstract

Students were randomised to a four-session sleep-education module or to a general wellbeing session. Exam-week sleep was 23 minutes longer per night after the module.

1. Methods

Design: individually randomised controlled trial. Participants: 158 undergraduates enrolled before the autumn exam period. Intervention: a four-session sleep-education module. Comparator: one general wellbeing session. Primary outcome: actigraphy-measured sleep duration (minutes per night) during exam week.

2. Results

Sleep duration was 23 minutes per night longer in the module group (mean difference 23 minutes, 95% CI 9 to 37).

3. Limitations

Actigraphy data were incomplete for 14 students, and exam-week sleep may not reflect sleep during the rest of the term.
